

PRODUCT	BRADERM KURAC
PRIMARY PACKAGING	AIRLESS 30ML
CATEGORY	MEDICAL DEVICE CLASS IIA
	Innovative formula, unique on the market, in cream formulation. It is not a simple cream based on Benzoyl peroxide alone, but rather an association with retinol palmitate, which allows the penetration of BPO into the hair follicle. Zinc sulphate regulates the sebaceous gland in the production of sebum. Enriched also by the presence of undecylenic acid, an important feature of this formulation is the presence of 18-beta-glycyrrhetic acid and phytosphingosines: this complex allows to reduce the aggressive effects of benzoyl peroxide making the product well tolerated.
ACTIVE INGREDIENTS	BENZOIL PEROXIDE: 4% Powerful ANTIBACTERIAL action against PROPIONIBACTERIUM ACNES. Its mechanism of action consists in releasing oxygen during its transformation into BENZOIC ACID and since it is an anaerobic bacterium, that is, it lives in the absence of oxygen (anaerobiosis), the presence of this released element determines its death. Unlike antibiotics, benzoyl peroxide does not create RESISTANT STRAINS. It also has a keratolytic and sebostatic action. It counteracts hyperkeratinization and excessive sebum production. It could cause a slight irritation on the skin which tends to reduce at times, especially in the initial phase, for this reason it may be useful to apply the product every other day. MANDELIC ACID: 1% It is an ALPHA-HYDROXYACID (AHA) extracted from bitter almonds and is also called AMYGDALIC ACID. Known for its exfoliating, antioxidant and antibacterial properties, it is less aggressive than glycolic acid and has a higher degree of safety on any skin type. Mandelic Acid gives excellent results in the treatment of acne

ACTIVE INGREDIENTS	LACTOBIONIC ACID: 1% Equipped with moisturizing and antioxidant properties, it belongs to the new generation of AHAs (alpha hydroxy acids) called poly-hydroxy acids and is therefore more delicate on the most sensitive skin. ZINC SULFATE:1% Anti-seborrheic action, regulates the activity of the sebaceous gland. RETINOL PALMITATE (blend): 0,5% Keratolytic action. PHYTOSPHINGOSINS: 0,2% They are LIPID molecules that occur naturally in the skin. They are present in high concentration in the stratum corneum where they are useful for the formation of CERAMIDS 3 and 6, with which they participate in the formation of the skin barrier. In their free form they possess ANTIBACTERIAL and ANTI-INFLAMMATORY activity as they are able to inhibit PROTEIN KINASES (proteins involved in the inflammatory response), and also act as cellular mediators in maintaining cellular homeostasis. GLYCYRRHETINIC ACID: 0,5% Extracted from licorice, it has a structure similar to that of steroids in fact it is able to stimulate an increase in the endogenous production of corticosteroids, as it is able to inhibit the enzymes 4 and 5 beta-reductases that inactivate steroids. Its topical application has a soothing and anti-inflammatory action due to its ability to bind to the same steroid receptors and work in a similar way, without giving them the same side effects. UNDECYLENIC ACID: 0,80% It is an unsaturated aliphatic acid obtained from the oil of some legumes and has an ANTIMICOTIC and ANTIBACTERIAL activity.
HOW TO USE	APPLY 1 or 2 TIMES A DAY OR EVERY DAY ACCORDING TO THE ADVICE OF THE DOCTOR, AFTER WASHING THE AFFECTED AREA WITH A SPECIFIC PRODUCT, WITH WARM WATER. USE KURAC FOR AT LEAST 1 MONTH
