

PRODUCT	BRADERM AZN CREMA
PRIMARY PACKAGING	AIRLESS DA 30 ml
CATEGORY	DERMOCOSMETIC
	It is a cream with a complete formula for the treatment of mild and moderate inflammatory acne. Thanks to the presence of azeloglycine, it prevents the overproduction of sebum and reduces the inflammation induced by Cutibacterium acnes (Probionibacterium acnes). Nicotinamide has an anti-inflammatory action comparable to clindamycin without giving bacterial resistance. In addition, the formula contains a complex of medium / high protection sunscreens reducing the harmful effects of UVA and UVB radiation.
HOW TO USE	Use AZN CREAM 1 or 2 times a day.
AZELOGLYCINE 6%	It represents a water-soluble derivative of Azelaic acid, therefore it is more chemically stable and more effective. Azeloglycine has antibacterial properties as it inhibits cellular protein synthesis, it also performs a sebostatic activity linked to the reduction of fatty acids, inhibiting 5-α reductase. It also has an anti-keratinizing action by controlling the proliferative processes of keratinocytes favoring the lysis of comedones. It has an anti-inflammatory action. It is not photo-sensitizing and this is a considerable advantage since it is possible to use the product even in the summer period. It has an inhibitory action against tyrosinase, a key enzyme for the synthesis of melanin, which is why it is also used in the treatment of melasma.
NICOTINAMIDE 6%	Its anti-inflammatory action is based on multifactorial mechanisms: it inhibits the release of histamine, inhibits leukocyte chemotaxis and the synthesis of interleukins. It also has a stabilizing effect on the skin barrier, normalizing the production of epidermal sphingolipids, in particular ceramides. It has a good moisturizing action, and is well tolerated by the skin.
BIOLIN-P® 1%	Innovative ingredient based on Prebiotics. Inulin and alpha-glucoligosaccharides are an important support for the development and proliferation of beneficial skin microflora. The skin microbiota represents a key element in the skin protection system against aggression by

	pathological agents and environmental stressors. For this reason, it has been shown that the inclusion of PREBIOTIC substances in the formulation strongly helps to strengthen the defense of the skin from pathogenic and opportunistic bacteria as in the case of Cutibacterium acnes (Probionibacterium acnes). Furthermore, these active ingredients have a direct action on the bacterial flora that cause skin diseases by preventing their proliferation by stimulating the production of Beta-defensins, peptides with an "antibiotic" action physiologically secreted by keratinocytes.
ARCTIUM LAPPA ROOT EXTRACT 1%	It is a plant that can be found up to 1700 meters above sea level and the roots are mainly used for the therapeutic purpose. It has an antibacterial and antifungal action. The arcthiopicrin extracted from this species is a natural antibiotic capable of reducing the colonization of Propionibacterium acnes, responsible for the appearance of papules. Arctic acid promotes healing, while Inulin has antifungal power.
UNDECYLENIC ACID 0,2 %	Antifungal and antimicrobial action.
UV FILTERS	Chemical UV filters (SPF 30)
