

DORSAK

PACKAGING : 100ml spray bottle

CATEGORY: MEDICAL DEVICE class IIA

An easy to apply emulsion spray formulation

Dorsak represents a new specific treatment for back acne. The product very easy to apply, even in difficult areas to reach such as the back. The specific formulation works against *Propionibacterium Acnes*, the first etiological agent of acne, in order to obtain maximum compliance for the patient.

Propionibacterium Acnes is an anaerobic bacterium therefore capable to proliferate without oxygen but unable to survive in an environment in which molecular oxygen is released, for this reason the 6% Benzoyl Peroxide (BPO) contained in Dorsak is particularly effective.

The innovation of the product is the presence of other substances, such as Retinol Palmitate that with its keratolytic and smoothing properties, allows the BPO to penetrate into the hair infundibulum, where the pathogenic bacterium nestles causing their death. Furthermore, Lactobionic Acid also exerts a gentle exfoliating action, while helping to maintain the skin hydrated.

Zinc Sulphate helps modulate the production and release of sebum by the sebaceous gland. The Azelogyline antibacterial, sebostatic and anti-inflammatory properties increase Dorsak's effectiveness, together with Nicotinamide, which exerts an anti-inflammatory effect on acne while helping to restore the functionality of the skin barrier and keep the skin hydrated.

ACTIVE INGREDIENTS

CHERATOLYTIC ACTION

- **RETINOL PALMITATE 0.5%**

Vitamin A Palmitate, or retinyl palmitate, is an esterified form of vitamin A, fat-soluble and easily absorbed by the skin. It has an antioxidant action, promotes the production of collagen, and improves skin appearance. Its keratolytic action determines the proliferation and differentiation of keratinocytes, which increases the cell turnover and lead to a smoother skin.

- **LACTOBIONIC ACID 2%**

Thanks to its moisturizing and antioxidant properties, it belongs to the new generation of AHAs (alpha hydroxy acids) called poly-hydroxy acids, of which it retains the exfoliating capacity. The high molecular weight slows down the penetration with a delicate action on sensitive skin which favours a superficial cosmetic action smoothing the corneal tissue and enhancing its regeneration. As it is a very hygroscopic molecule, it retains water and reduces the loss of skin hydration while remodeling and increasing the thickness of the derma.

ANTIBACTERIAL AND ANTI-INFLAMMATORY ACTION

- **BENZOYL PEROXIDE 6%**

Powerful antibacterial action against *Propionibacterium Acnes*.

Its mechanism of action consists in releasing oxygen during its transformation into Benzoic Acid as it is an anaerobic bacterium, and therefore lives in the absence of oxygen (anaerobiosis), the presence of the oxygen, which is released determines its death.

Unlike antibiotics, Benzoyl peroxide does not create resistant strains.

It also has a keratolytic and sebostatic action as it can counteract hyperkeratinization and the excessive production of sebum.

Especially in the early stages of treatment, this substance could cause a slight irritation which tends to reduce with the following applications, to this extent it may be useful to use the product every other day.

- **AZELOGLYCINE 5%**

A water-soluble derivative of Azelaic acid, it is more chemically stable and more effective.

Azeloglycine has antibacterial properties as it inhibits cellular protein synthesis, it also performs a sebostatic activity linked to the reduction of fatty acids, inhibiting the 5- α reductase.

It has an anti-keratinizing action which controls the proliferative processes of keratinocytes, favouring the lysis of comedones.

It has an anti-inflammatory action.

It is not photosensitizing and has an inhibitory action against tyrosinase, a key enzyme for the synthesis of melanin, for this reason it is also used in the treatment of melasma.

- **NICOTINAMIDE (VITAMIN PP) 5%**

A Water-soluble vitamin well known for its multiple applications, especially in dermatology.

It has a strong anti-inflammatory properties and its mechanism of action is given by the antihistamine activity, scavenger of free radicals and inhibitor of the 3- enzyme 5 AMP cyclic phosphodiesterase.

SEBUM REGULATING ACTION

- **ZINC SULFATE 1%**

Regulates the mechanism of production and secretion of sebum by the sebaceous gland exercising an effective anti-seborrheic action

POSODOLOGY:

Apply following daily or every other day according doctor's advice, after cleansing the back area with a specific product.

INSTRUCTIONS FOR USE :

Massage gently until complete absorption, wait a few of minutes before putting on clothing. It is recommended to apply in the evening and to wear white clothing as the BPO may stain coloured garments.

INDICATIONS: BACK ACNE, FOLLICULITIS
