

PRODUCT**BRADERM VERSIACTIVE SPRAY**

PACKAGING	SPRAY BOTTLE 100 ml
CATEGORY	DERMOCOSMETIC
DESCRIPTION	High tolerance spray emulsion specific for seborrhea, with moisturizing and purifying action. Thanks to its principles, it guarantees a sebum-balancing action while promoting normalization of excessive skin flaking. Relieves the annoying sensation of itching, avoids excessive skin dryness, and thanks to the presence of glycyrrhetic acid and beta-glucan, restores the physiological conditions of the skin.
PRINCIPI ATTIVI	CICLOPIROXOLAMINE (CPO) 0,1 % It belongs to the hydropissiridones family. CPO has a strong antifungal and antibacterial action, blocks the production of ATP (adenosine triphosphate), an energy reserve necessary for the vital functions of the fungal cell. Blocks carriers carrying leucine, valine and phenylalanine, with disruption of mRNA and protein synthesis. Furthermore, CPO binds and subtracts FE^{+++}, inactivating cellular enzymes, causing the death of fungi and bacteria. CPO is recognized as having an important anti-inflammatory action as it inhibits the inflammatory mediators originating from arachidonic acid by the action of 5 alpha lipoxygenase. ITRACONAZOLE 0,1 % Its mechanism of action occurs on the cytoplasmic membrane of the fungus by inhibiting the action of cytochrome P450, consequently blocking the synthesis of ergosterol which represents the main steroid component of the cytoplasmic membrane with consequent rupture. Latest generation antifungal with broad spectrum activities. PIROCTONE OLAMINE (OCTOPIROX) 0,5% Important active ingredient for its ability to reduce both inflammation and bacterial load, it also has an important antifungal action. For this reason it is very suitable in seborrheic dermatitis, where there is always an inflammation with overlapping of bacteria and fungi. TIOCONAZOLE 0,25% novità 2022* Tioconazole is an active ingredient belonging to the category of imidazole derivatives with a broad spectrum of action that guarantees its therapeutic activity both against yeasts, dermatophytes and fungi and against Gram positive bacteria. Like other antifungals, this active principle, applied topically, easily permeates the membranes of microorganisms, accumulating in the cytoplasm and inhibiting the enzyme 14 alpha methyl Lanosterol demethylase, thus determining: - Reduced synthesis of ergosterol, a key element for the structure and

	functioning of the plasma membrane; - Accumulation of intermediate metabolites that reduce the activity of the various membrane enzymes, thus causing a significant reduction in exchange and energy capacity. All this is achieved without the active ingredient being absorbed systemically, thus limiting the appearance of side effects and adverse reactions. SALICYLIC ACID 0,5 % Keratonormalizing with high desquamating action. Plays also an important antiseptic and fungicidal action. GLYCYRETINIC ACID 0,2 % It has a high anti-inflammatory activity by reducing the redness and burning of the affected area. BETAGLUCAN 0,1 % It is a natural element of plant origin that is found in the walls of fungi and yeasts, it carries out an important anti-inflammatory activity by activating macrophages and reducing free radicals. Protects and moisturizes the skin by reducing the annoying itching sensations. Evening primrose oil 0,5 % Thanks to the presence of essential fatty acids of vegetable origin such as Omega 6, gamma linolenic acid, it has an important anti-inflammatory action. ZINC OXIDE 0,2 % Anti-inflammatory and soothing action.
	* to replace Zinc Pyrithione, removed from cosmetic products as per the latest directives.
